

E4 — Lean / trust boundary: NOT RUN

Status: INCONCLUSIVE (not started). The pre-build checkpoint (`00_CONTROL/PREBUILD_CHECKPOINT.json`, 2026-09-28T11:24-03:00) recorded decision **STOP** because of the confirmed attribution blocker F-01 (E7). Request §4.1: "No unresolved blocker, including a material attribution problem, permits `PROCEED_TO_BUILD`"; §4.2: "Do not run the full build merely to finish the checklist after finding such a blocker."

Environment already verified at intake (reusable for a resumed run only after re-verification): Lean toolchain v4.28.0 installed; all nine dependency HEADs equal the frozen `lake-manifest.json` pins with no tracked changes (`00_CONTROL/ENVIRONMENT.md`). No build directory was created, no cache fetched, no Mathlib touched.

Reserved dynamic checks (to run against the corrected target, if the author's correction leaves the Lean cut unchanged the E0 identity of `LEAN_SOURCE_SNAPSHOT_v1.0.zip` must be re-established first): see `PREBUILD_CHECKPOINT.json` → `reserved_dynamic_checks_for_E4`.

Static evidence available instead (not a substitute): E3 textual sweep found no code-level `sorry`, `admit`, `project` `axiom`, `native_decide`, `implemented_by`, `unsafe`, `opaque`, `extern`, `ofReduceBool`, `skipKernelTC`; metaprograms only in audit modules, none using `addDecl`. The axiom footprint claim (`propext`, `Classical.choice`, `Quot.sound`) is **unverified by this audit**.

Rendered from the Markdown semantic source with PyMuPDF; not compiled from the TeX file (no TeX engine installed).
